Information about Copyrighted Content

Some instruments administered as part of this study may contain in whole or substantially in part contents from copyrighted instruments. Reproductions of the instruments are provided as documentation for the analysis of the data associated with this collection. Restrictions on "fair use" apply to all copyrighted content. More information about the reproduction of copyrighted works by educators and librarians is available from the United States Copyright Office.

NOTICE
WARNING CONCERNING COPYRIGHT RESTRICTIONS

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted material. Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

USER GUIDE

FILE OVERVIEW

Part Number	Part Name	Restricted	Number of Variables	Waves Covered	Repeating Variables
1	Acculturation Rating Scale for Mexican Americans – II (ARSMA-II)		606	All	55
2	Brief Symptom Inventory	YES	859	All	78
3	Caring Adult		479	All	42
4	Characteristics of Family	YES	549	ALL	36
5	Characteristics of Friends		497	ALL	46
6	Characteristics of Romantic Relationships		17	Baseline	NA
7	Children's Emotional Intensity – Child Report	YES	144	All	13
8	Community Involvement		112	All	10
9	Demographics	YES	256	All	12
10	Psychopathy Checklist: Youth Version	YES	27	Baseline	NA

55	Youth Psychopathic Traits Inventory (YPI)		671	1 to 10	67

- All files contain one record for each original respondent. Therefore, there are 1,354 cases in each file. Each file is sorted by the variable CASEID which acts as the respondent's ID number for linking files together.

- The column for repeating variables primarily refers to the follow-up waves. The Baseline file typically contains some, but not all, of the same variables in the follow-up waves.

- These data were released in waves to facilitate access to the study for research purposes.

  Release #1 included parts 6, 13, 17, 18, 19, 23, 25, and 40.
  Release #2 included parts 8, 9, 12, 21, 22, 28, 35, 39, 46, 47, 51, 53, and 55.
  Release #3 included parts 1, 7, 10, 16, 24, 30, 31, 34, 36, 37, 42, 49, and 50.
  Release #4 included parts 2, 3, 11, 20, 26, 33, 38, 41, 43, 45, and 54.
  Release #5 included parts 4, 5, 14, 15, 27, 29, 32, 44, 48, and 52.

Acculturation Rating Scale for Mexican Americans-II (ARSMA-II)

The Acculturation Rating Scale for Mexican Americans-II (ARSMA-II; Cuellar, Arnold, & Maldonado, 1995) was adapted for this study to measure the adolescent's cultural orientation toward Mexican and Anglo cultures. This instrument was only administered to adolescents who identified themselves as Mexican-American. The scale contains 48 items to which participants respond on a 5-point Likert scale ranging from "Not at all" to "Extremely often or almost always," with higher scores indicating greater cultural orientation. Six subscales are proposed for the ARSMA-II: Mexican Orientation - general (MOS; e.g., "I enjoy speaking Spanish."), Mexican Orientation - Affiliation (e.g., "My friends, while growing up, were of Mexican origin."), Mexican Orientation - Language (e.g., "I enjoy listening to Spanish language music."), Anglo Orientation - general (AOS; e.g., "I speak English."), Anglo Orientation - Affiliation (e.g., "My friends now are of Anglo origin."), and Anglo Orientation- Language (e.g., "I enjoy English language TV.").

This ARSMA questions are asked at baseline and at all followup interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set

Brief Symptom Inventory (BSI)

The Brief Symptom Inventory (BSI; Derogatis & Melisaratos, 1983) is a 53-item self-report inventory in which participants rate the extent to which they have been bothered (0 ="not at all" to 4="extremely") in the past week by various symptoms. The BSI has nine subscales designed to assess individual symptom groups: somatization (SOM, e.g., "Faintness or dizziness"), obsessive-compulsive (OC, e.g., "Having to check and double-check what you do"), interpersonal sensitivity (IS, e.g., "Feeling inferior to others"), depression (DEP, e.g., "Feeling no interest in things"), anxiety (ANX, e.g., "Feeling tense or keyed up"), hostility (HOS, e.g., "Having urges to break or smash things"), phobic anxiety (PHB, e.g., "Feeling uneasy in crowds, such as shopping or at a movie"), paranoid ideation (PAR, e.g., "Others not giving you proper credit for your achievements"), and psychoticism (PSY, e.g., "The idea that something is wrong with your mind"). The BSI also includes three scales that capture global psychological distress.

The BSI is administered at baseline and all follow-up waves. Variable names included in the dataset have been masked because the BSI is copyrighted. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure.

Caring Adult

The Contact with Caring Adults inventory was derived from several sources for this study (Nakkula, et al., 1990; Phillips and Springer, 1992; Institute of Behavioral Science, 1990). It assesses the type and range of supportive adults in the adolescent's life. This support is assessed across eight domains: adults you admire and want to be like, adults you could talk to if you needed information or advice about something, adults you could talk to about trouble at home, adults you would tell about an award or if you did something well, adults with whom you can talk about important decisions, adults you can depend on for help, adults you feel comfortable talking about problems with, and special adults who care about your feelings. This measure asks youth to identify the total number of adults who are supportive in each domain as well as to nominate the three adults the youth is most likely to turn to within each domain. These endorsements are summarized across the eight different domains in three ways - the total domains with a person named, the diversity of the individuals named across the domains, and the depth of the pool of individuals named across the domains. The first of the dimensions calculated, Domains of Social Support, provides the number of different domains for which at least one caring adult is present. Diversity of Caring Adults, the second dimension of social support, identifies the unique individuals mentioned across all eight domains. Diversity of Caring Adults is further refined by also calculating the number of caring adults mentioned in the particular domain in which the youth identifies the highest number of caring adults (Maximum Diversity Within Domains). Finally, the Depth of Social Support assesses the number of caring adults who are mentioned in more than two domains, and further distinguishes between sources of support that are familial versus non-familial.

The Caring Adult inventory was administered at baseline and all follow-up interview waves. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Characteristics of Family

This question set includes items from eight areas within the interview that describe aspects of the adolescent's family situation. Specifically, we are including items here that describe the biological parent's generational status, the native language of the biological parents, educational attainment for parents (refers to parents they live with and is not limited to biological parents), employment status of parents (refers to parents they live with and is not limited to biological parents), presence of siblings in the household, criminal history of family members, the history of mental health hospitalization of family members, and a description of the relationship with parents (not limited to biological) while growing up.

The questions were asked at baseline and a subset of questions are repeated at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Characteristics of Friends

This set of questions focus on the subject's four closest friends and includes background questions about their history of arrest and mental health hospitalization as well as the level of contact the subject has with these friends. These questions are supplemented by a separate measure establishing the quality of the relationships with these friends (see the "friendship quality" measure).

The questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Characteristics of Romantic Relationships

In this section, the subject is asked about various aspects of current and past romantic relationships, including some limited aspects of prior sexual activity. These questions were devised to assist in making ratings for the Psychopathy Checklist - Youth Version, but they are included here as individual items. There are no summary scales calculated. The information provided here about the current romantic partner can be supplemented with ratings regarding the quality of that relationship, including the amount of influence that this partner exerts regarding involvement in antisocial activities (see Quality of Romantic Relationship measure).

The questions were asked at baseline only (Quality of romantic relationships is available for all follow-up interviews). See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Children’s Emotional Intensity – Child Report

The Children's Emotion Regulation scale was adapted for this study to serve as a self-report measure of the adolescent's ability to regulate emotions (Walden, Harris, Weiss, & Catron, 1995). Only a subset (n=12) of the 33 original items contained in this scale are included in the Pathway's version. Examples of items are "I know things to do to make myself more happy," and "I can change my feelings by thinking of something else". Participants respond on a 4-point Likert scale ranging from "Not at all like me" to "Really like me". Higher scores indicate a better ability to regulate emotion.

This information is provided for the baseline and all follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this scale.

Community Involvement

The Community Involvement scale (Elliot, 1990) was modified for this study to assess the adolescent's involvement in structured community activities. Scores indicate the extent of the adolescent's involvement in four different community organizations (e.g., sports teams, scouts, church related groups, and volunteer work).

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Demographics

This section contains items which are descriptive characteristics of the subject; certain items are available at baseline only and others are available for all waves. Specifically, baseline information is available regarding the youths gender, ethnicity, site location, household composition, subject's children and pregnancy status at baseline as well as an indicator of the proximity of the youth's home to public housing. Information for each interview followup wave includes age, death of a biological parent or primary caregiver during the recall period, military service and voting.

See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Psychopathy Checklist: Youth Version

The Psychopathy Checklist: Youth Version (PCL-YV; Forth, Kosson, & Hare, 2003) assesses psychopathic characteristics among youth. Procedures advocated by the authors suggest a 60-90 minute, semi-structured interview to assess the youth's interpersonal style, obtain information on a variety of aspects of his/her history and current functioning, and assess the credibility of his/her statements. However, the Pathways study was unable to accommodate an interview of this length to assess psychopathy. Instead, all questions from the PCL-YV interview guide were incorporated into the Pathways baseline interview battery. Nearly all were asked in the open-ended format suggested by the PCL-YV authors. Following the baseline interview, interviewing staff generated a report which pulled all of the PCL-related answers from the full interview. With this information in hand, as well as information from court records and the parent collateral interview, the interviewer completed the PCL-YV rating form. This form lists 20 separate items for which the youth is rated on a 3-point ordinal scale: "0" item does not apply to the youth, "1" item applies to a certain extent and "2" item applies to the youth.

The PCL-YV was administered at the baseline interview only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure.

The Domestic Violence Inventory, adapted for this study, is designed to measure four dimensions of victimization and offending for events that occur within the past year between the subject and any of his/her intimate partners (boyfriend or girlfriend), spouse, ex-spouse, or ex-partner (ex-boyfriend or girlfriend). We include four domains of intimate partner violence and victimization: physical violence (e.g., "Has your partner grabbed, pushed, or shoved you?"), psychological aggression (e.g., "Have you called your partner stupid, fat or ugly?"), controlling behavior (e.g., "Has your partner restricted your use of the car or telephone?"), and injury (e.g., "Have you ever passed out from being hit by your partner?"). We also include items on sexual coercion (e.g., "Have you used physical force your partner to have sex with you?"), but distinguish it from physical violence.

This information is collected starting with the fourth interview (s4) and continued for the remaining follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Early Onset of Behavior Problems

A series of five questions are used to establish the early onset of behavior problems (problems before age 11). These questions were used as part of the items considered in rating the Psychopathy Checklist - Youth Version (Forth, et al., 2003).

These questions were asked at baseline only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Emotionality Activity, Sociability and Impulsivity inventory (EASI)

The EASI is a measure of temperament that was modified for this study to assess the adolescent's internal emotionality (Buss & Plomin, 1984). Examples of items are "I am almost always calm-nothing ever bothers me," and "I tend to be nervous in new situations." The scale contains 14 items to which participants respond on a 5- point Likert scale ranging from "Strongly disagree" to "Strongly agree". Higher scores indicate greater emotionality.

This measure was administered at baseline only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the measure.

Education (Baseline): School Bonding, Attendance, Activities, and Orientation

This dataset includes descriptive information regarding the youth's education at the time of the baseline interview. The information included is related to attendance, achievement and behavior problems. Summary scores regarding school bonding and orientation are also provided. This information is available for both community and facility schools attended.

This information is provided for the baseline interview only. Additional information about education during the follow-up period is provided in the school calendar dataset. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Education: Follow-Up – School Bonding, Grades, Activities, and Orientation

This dataset includes descriptive information regarding the youth's education for each of the followup interviews. This information closely parallels that contained in the baseline education database and includes school attachment and descriptive information about the school experience (grades, achievement and involvement in school activities). In addition, starting with version 01.16 of the interview, additional questions are asked regarding college experiences (e.g. attendance, major, financing, attitudes and experiences at college).

This dataset contains information for each of the follow-up interview. Additional information about education during the follow-up period is provided in the school calendar dataset. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Employment

This section includes descriptive items regarding the youth's prior employment experience and several items related to financial responsibility at the time of the baseline interview.

Questions about employment include job type, wages, length, history of being fired and money from illegal activity. The items related to financial responsibility were taken from questions asked as part of the Psychopathy Checklist - Youth Version rating. There are no summary scores calculated. These are all simply individual items about prior work (legal and illegal) and prior examples of financial responsible behavior.

This information is provided for the baseline interview only. Additional information about employment during the follow-up period is provided in the Making and Spending Money calendar. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Exposure to Violence

The Exposure to Violence Inventory (ETV; Selner-O'Hagan, Kindlon, Buka, Raudenbush, & Earls, 1998) was modified for this study to assess the frequency of exposure to violent events. Items from the ETV document the types of violence the adolescent has both experienced (i.e., Victim - 6 items, e.g., "Have you ever been chased where you thought you might be seriously hurt?") and observed (i.e., Witnessed - 7 items, e.g., "Have you ever seen someone else being raped, an attempt made to rape someone or any other type of sexual attack?"). In addition to these items about experiences with violent incidents, four questions inquire about the youth's exposure to death (e.g. has anyone close to you tried to kill him/her self, has anyone close to you died, have you ever found a dead body, have you ever tried to kill yourself). Finally, one open-ended item assesses involvement in other types of situations which could have led to death or serious injury. In total, this scale inquires about 17 types of situations. If an item is endorsed, a series of follow-up questions are asked. For most items (all of the "victim" and "witness" items with the exception of rape), the follow-up questions are limited to the frequency of the event. If the subject reveals that he/she has been raped or sexually assaulted, more detail is obtained. Specifically, four additional questions are asked (i.e. "has it happened more than once", "relationship of perpetrator", "location of incident", and "location if other").

The Exposure to Violence inventory was administered at baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Friendship Quality

The items in the Friendship Quality scale are an adaptation of those included in the Quality of Relationships Inventory (Pierce, et al. 1994). The original scale was designed to measure interpersonal support from a single romantic partner but our adaptation changed the focus to a global rating regarding the youth's five closest friends (participants are asked to average the rating across these closest friends). The scale contains 10 items which vary the context of support offered (e.g. "How much can you count on the people for help with a problem", "How close do you think you will be to these people in ten years" and "How much do you depend on these friends"). The youth responds on a 4-point Likert scale ranging from "not at all" to "very much". These questions are supplemented by a separate measure focusing on the background of the subject's four closest friends, including history of arrest and mental health hospitalization (see the "Characteristics of Friends" measure).

The scale was administered at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the scale.

Future Outlook Inventory

The 15-item Future Outlook Inventory used in this study was developed by Cauffman and Woolard (1999; unpublished), using items from the Life Orientation Task (Scheier & Carver, 1985), the Zimbardo Time Perspective Scale (Zimbardo, 1980), and the Consideration of Future Consequences Scale (Strathman, Gleicher, Boninger, & Edwards, 1994). The Future Outlook Inventory asks participants to rank from 1 to 4 (1= Never True to 4= Always True) the degree to which each statement reflects how they usually are (e.g., I will keep working at difficult, boring tasks if I know they will help me get ahead later). Higher scores indicate a greater degree of future consideration and planning.

This inventory was administered at baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the inventory.

Gang Involvement

This measure includes a series of questions that assess the youth's gang involvement during the recall period. The questions are taken mainly from Thornberry, Lizotte, Krohn, Farnworth, and Jang, (1994) and Elliott (1990). If gang involvement is endorsed, additional items explore the youth's subjective experience of the gang (i.e. youth's position in the gang, the importance of the gang to the youth) and the cohesiveness of the gang (i.e. presence of identifying colors, rules of socialization).

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Gun Accessibility

Gun violence by teenagers most often involves one of two types of guns: handguns (.38mm) and automatic weapons (9 mm). To assess the availability of guns and estimate the presence of gun markets as part of the neighborhood context, we ask how easy it is for teenagers to purchase guns in their neighborhood, and the estimated prices of the two types of guns most commonly carried and used by adolescents.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Head Injury

Four descriptive items regarding head injury were asked of the participant at the baseline interview to establish the presence of brain injury (e.g. how many times the subject had a head injury that resulted in the loss of consciousness), the age at which the injury occurred and the extent of the injury (e.g. presence of seizures and medical treatment).

See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set

Healthcare

The three items used in this section were selected from the ongoing research from the MacArthur Network on Transitions to Adulthood and created by Frank F. Furstenberg (2000). The section includes three items which inquire about the subject's status of health insurance, location of healthcare, and overall quality of health.

These questions were asked beginning at the 24-month interview (s4) and at each interview thereafter. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about these questions.

HIV Risk Behaviors

This section contains 13 questions that evaluate the subject's level of risk for becoming infected with HIV.

This information is collected starting with the fourth interview (s4) and continued for the remaining follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Importance of Spirituality

The Importance of Spirituality measure, developed by Maton (1989), is a highly reliable assessment of spirituality (Maton, Teti, Corns, Vieira-Baker, Lavine, Gouze, and Keating, 1996). The scale contains three items that ask participants to indicate how much their actions are influenced by belief in a god. Participants respond on a 5- point Likert scale ranging from "Not at all true" to "Completely true," with higher scores indicating a greater degree of spirituality. These three items are summed into a single scale score. Two additional items are included to evaluate the importance of one's religion (e.g., "How important has religion been in your life?"), as well as the participant's average yearly service attendance (e.g., "During the past year, how often did you attend church, synagogue, or other religious service?"). These are left as individual items.

Administered at Baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure.

Indices of Personal and Social Costs and Rewards

Empirical evidence on deterrence suggests that offending has both personal and social rewards and that punishment associated with this offending has distinct social and personal costs (Williams and Hawkins, 1986; Nagin, 1998). Previous tests with general populations of adolescents (Grasmick et al., 1990) and college students (Nagin and Paternoster, 1991, 1994) show that these costs form essential components of a dynamic model of deterrence that includes both the punishment costs of arrest and the social costs of detection and punishment. As a result, the Indices of Personal and Social Costs and Rewards were adapted for this study to measure the adolescent's perceived likelihood of detection and punishment for any of several types of offenses (Nagin and Paternoster, 1994). This measure is comprised of five dimensions: Certainty of Punishment {Others & You (e.g., "How likely is it that kids in your neighborhood would be caught and arrested for fighting?")}, Social Costs of Punishment (e.g., "If the police catch me doing something that breaks the law, how likely is it that I would be suspended from school?"), Personal Costs of Punishment {Variety & Weight (e.g., "Has your court sentence kept you from hanging out with your friends as much as you used to?")], Social Rewards of Crime [Stealing, Fighting & Robbery (e.g., "If I take things, other people my age will respect me more.")}, and Personal Rewards of Crime (e.g., "How much 'thrill' or 'rush' is it to break into a store or home?").

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about these questions.

Information Related to Pregnancy and Children

This dataset contains information related to the subject's status as a parent, descriptive information about his/her children and involvement with child protective services. Specifically, the following areas are covered: current pregnancy status and status during the recall period, descriptive information for each of the subject's children (child's age, frequency of contact with the child, biological status, and whether the child lives with the subject). We also obtain information about the subject's contacts with child protective services regarding the subject's own children or children in their care (although there is data in only s9 and sA for this set of variables).

This information is provided for all follow-up interview waves although certain variables were only added to the interview in later waves. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Interview Information

The Interview Information section is comprised of variables that describe the basic facts related to when and where the research interview was completed. We include information such as the date of the interview and the interview location (e.g. institution, public place).

Four additional bits of information are available and these require more explanation:

- Version number in which the interview was conducted; [S#QVersion].
- Interview completion status (S#IntCompStat). A variable which indicates whether the follow-up interview was completed, missed or partially completed.
- Number of recall months; [S#NMonths].
- Number of days in the recall period; [S#DaysInRP].

This information is available for interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Miscellaneous

A subset of variables comes from the calendar data has also been made available here to supplement the measure data. This subset of summary variables is provided with no restrictions to facilitate the ease of certain types of analyses (the full set of information contained in the calendar data for each area is restricted access at ICPSR). These variables will be briefly described below, but we recommend referring to the codebook section of each calendar for a more detailed explanation.

- From the living calendar: Unique location ID, type of location, number of people in the household, relationship of people in the household.
- From the making and spending money calendar: Weeks worked in legal, community and under-the-table jobs, separately and combined.
- From the out of community placement calendar: proportion of the recall period in all institutional settings, proportion of recall period in just settings with no community access.
- From the court monitoring calendar: indicator of probation status in each recall period

This information is provided for all follow-up interview waves. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about each question set.

Moral Thinking

The Mechanisms of Moral Disengagement (Bandura, Barbarnelli, Caprara, & Pastorelli, 1996) was used for this study to measure the adolescent's attitudes concerning the treatment of others. The self-report measure contains 32 items to which participants respond on a 3-point Likert scale ranging from "Disagree" to "Agree," with higher scores indicating a greater moral detachment. Items from the scale tap the following eight dimensions: moral justification (e.g., "It is alright to beat someone who bad mouths your family."), euphemistic language (e.g., "Slapping and shoving someone is just a way of joking."), advantageous comparison (e.g., "It is okay to insult a classmate because beating him/her is worse."), displacement of responsibility (e.g., "Kids cannot be blamed for using bad words when all their friends do it."), diffusion of responsibility (e.g., "A kid in a gang should not be blamed for the trouble the gang causes."), distorting consequences (e.g., "Teasing someone does not really hurt them."), attribution of blame (e.g., "If kids fight and misbehave in school it is their teacher's fault."), and dehumanization (e.g., "Some people deserve to be treated like animals."). Other investigators using this measure and the instruments' authors, however, advise that the subscales should not be used because of their inconsistency and unreliability. As a result, we only calculate two scales indicating overall performance across all the items.

The Moral Disengagement scale was administered at baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this scale.

Motivation to Succeed

The motivation to succeed items are taken from Eccles et al. (1998). Six items tap the subject's assessment of the opportunities available in his/her neighborhood regarding schooling and work. At each follow-up interview, this measure reflects the perceived opportunities for the neighborhood where the adolescent lived the longest during the recall period. An additional two items are included regarding the adolescent's perceptions of how far they would like to go in school and how far they think they will go in school.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Multigroup Measure of Ethnic Identity

Sections of the Multigroup Measure of Ethnic Identity are used to determine an individual's overall sense of ethnic identity (Phinney, 1992). Items from the measure assess feelings of Affirmation & Belonging (e.g., "I am happy that I am a member of the group I belong to"), and Identity Achievement (e.g., "I have spent time trying to find out more about my ethnic group, such as its history, traditions, and customs"). For this scale, participants respond to 12 items using a 4-point Likert scale ranging from "Strongly Disagree" to "Strongly Agree," with higher scores indicating greater ethnic identity.

This measure was administered at baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the measure.

Neighborhood Conditions

The Neighborhood Conditions Measure was adapted for this study to assess the environment surrounding the adolescent's home (Sampson & Raudenbush, 1999). Items from the self-report measure tap physical disorder of the neighborhood (e.g., "cigarettes on the street or in the gutters," "graffiti or tags"), as well as social disorder (e.g., "adults fighting or arguing loudly," "people using needles or syringes to take drugs"). The scale contains 21 items to which participants respond on a 4- point Likert scale ranging from "Never" to "Often," with higher scores indicating a greater degree of disorder within the community. An additional item is included to determine the amount of time the participant spends within his/her neighborhood where responses range from "None of my time" to "All of my time."

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

NEO Personality Inventory

The NEO-PI-SF (Costa P. & McCrae, R. 1989; McCrae, R. & Costa, P. 2004) is a widely used personality inventory to tap the "Big 5" dimensions of personality (i.e., neuroticism, extraversion, openness, agreeableness, and conscientiousness). It provides an assessment of emotional, interpersonal, experiential, attitudinal and motivational personality styles. The NEO is a self-report measure in which the participant rates the degree to which he/she thinks the statement is true about themselves (e.g. I shy away from crowds of people) on a 5 point Likert scale (1=disagree strongly to 5=agree strongly). This short form contains 120 items, making it useful for calculating dimension scores (of the five dimensions listed above), but not reliable enough to produce all facet scores (more fine-grained component scores that can be combined into dimension scores).

The NEO is administered only one time for the Pathways study, at the 24-month interview. Variable names included in the dataset have been masked because the PAI is copyrighted. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure.

Offense History

Several questions about the youth's offending are asked of the subject at baseline, including arrest history, past stays in a secure setting, age at first secure confinement and current charges. This information is based on self-report and is best used in conjunction with the official record information compiled from court record reviews in each site along with Federal Bureau of Investigation files. This official information is contained in a separate set of measures under the heading of "Official Court Records".

These questions were asked at the baseline interview only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Parental Monitoring

The Parental Monitoring inventory (Steinberg, Dornbusch, & Darling, 1992) was adapted for this study to assess parenting practices related to supervision of the adolescent (i.e. study participant). Preliminary questions establish the presence of a single individual (X) who is primarily responsible for the youth. The respondent's answers to several items about their current living situation, specifically whether they live with the identified caretaker, establishes the skip pattern followed in the parental monitoring items. The scale is composed of 9 items. Five items assess parental knowledge (e.g. How much does X know about how you spend your free time) and are answered on a 4-point Likert scale ranging from "doesn't know at all to "knows everything". Even if a youth does not live with the person identified as their primary caretaker, they are asked these questions. If the youth lives with the primary caretaker, four additional items are asked to assess parental monitoring of the youth's behavior (e.g. How often do you have a set time to be home on weekend nights?). These are answered on a 4-point Likert scale which ranges from "never" to "always".

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Parental Orientation

The Youths Parenting Orientation scale was adapted for this study from Silverberg and Steinberg's (1990) subscale of Adult Role Orientation. The questions are asked only of youth who report having a child. The scale is used to assess the participant's view of his/her role as a parent (e.g., "Fathers/Mothers my age should devote most of their time and energy to rearing their child/children") and the degree to which this role is pervasive in his/her life. The inventory is a 6-item scale that asks participants to rank from 1 to 4 (1= Agree Strongly to 4= Disagree Strongly) the degree that each statement corresponds to their view of parenthood, with higher scores indicating greater parent orientation.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Parental Warmth and Hostility

The Quality of Parental Relationships Inventory (Conger, Ge, Elder, Lorenz, & Simons, 1994) was adapted for this study to assess the affective tone of the parental-adolescent relationship. Items from the measure tap parental warmth - mother (e.g., "How often does your mother let you know she really cares about you?"), parental hostility - mother (e.g., "How often does your mother get angry at you?"), parental warmth - father (e.g., "How often does your father tell you he loves you?"), and parental hostility - father (e.g., "How often does your father throw things at you?"). The scale contains 42 items (21 to assess the maternal relationship and 21 to assess the paternal relationship) to which participants respond on a 4- point Likert scale ranging from "Always" to "Never". Items were reversed coded to generate the composite scores. Higher scores on the warmth scale indicate a more supportive and nurturing parental relationship. Higher scores on the hostility scale indicate a more hostile relationship. These questions were asked at baseline and at each follow-up interview.

In addition, for all followup waves, a series of questions were included to assess instrumental support (e.g. loan money, provide transportation) provided by the parents to the study participant.

See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about these question sets.

Peer Delinquency

The Peer Delinquent Behavior items are a subset of those used by the Rochester Youth Study (Thornberry et al., 1994) to assess the degree of antisocial activity among the adolescent's peers. There are two dimensions to this scale: Antisocial Behavior (e.g., "During the recall period how many of your friends have sold drugs?") and Antisocial Influence (e.g., "During the recall period how many of your friends have suggested that you should sell drugs?"). The scale contains 19 items to which participants respond on a 5-point Likert scale ranging from "None of them" to "All of them". Two additional scales assessing the antisocial activity among the adolescents romantic partner are also computed. Refer to the 'Quality of Romantic Relationships' codebook for descriptive information about these scales.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Perceptions of Chances for Success

The Perceptions of Chances for Success measure (also called perceptions of opportunity) was adapted from the work of Menard & Elliott (1996) to assess the adolescent's prediction of his/her future adult success. Items from the measure tap the adolescent's investment in and perceived likelihood for achievement in several areas. Specifically, the scale taps Aspirations for Work, Family & Law Abiding Behavior (e.g., "How important is it to you to have a good job or career?"), and Expectations for Work, Family, & Law Abiding Behavior (e.g., "What do you think your chances are to earn a good living?"). There are a total of 14 questions asked (divided evenly between aspirations and expectations) to which participants respond on a 5-point Likert scale ranging from "Not at all important/Poor" to "Very important/Excellent".

The measure was administered at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the measure.

Personality Assessment Inventory

The Personality Assessment Inventory (PAI) is an inventory of adult personality designed to provide information on critical clinical variables. The full PAI contains 344 items which comprise 22 non-overlapping scales. It is designed to be used with individuals from age 18 to adult. Two of the clinical scales (borderline and antisocial features) were administered one time to the Pathways study participants between the time of their 72-month and 84-month interviews. Study participant were an average age 21-22 at the time of administration

As noted above, this inventory was administered to the Pathways youth just one time. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure. Variable names included in the dataset have been masked because the PAI is copyrighted.

Procedural Justice

The Procedural Justice inventory was adapted for this study to measure the adolescent's perception of fairness and equity connected with arrest and court processing. The approach taken here was an adaptation of those taken by Tyler (1997). Conceptually, the idea is that there is an experiential basis for translating interactions with legal processes into perceptions and evaluations of the law and the legal actors that enforce it. This measure is designed to tap several dimensions of fair treatment: correctability, ethicality, representativeness and consistency (see Tyler and Huo, 2002). The outcomes of this process include evaluations of law and its underlying norms: legitimacy and legal cynicism.

The 55 items in this measure are divided into four sections: Police {Direct Experience & Others' Experience (e.g., "The police treat me the same way they treat most people my age.")}, Judge {Direct Experience & Others' Experience (e.g., "The court considered the evidence/viewpoints in this incident fairly.")}, Legitimacy (e.g., "I feel people should support the police."), and Legal Cynicism (e.g., "Laws are meant to be broken.").

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Psychosocial Maturity Inventory

The Psychosocial Maturity Inventory (PSMI Form D; Greenberger, Josselson, Knerr, & Knerr, 1974) has been used in previous research and shown excellent validity and psychometric properties (Greenberger & Bond, 1976). Items on the personal responsibility subscale tap self-reliance (i.e., feelings of internal control and the ability to make decisions without extreme reliance on others, e.g., "Luck decides most things that happen to me" {reverse coded}), identity (i.e., self-esteem, clarity of the self, and consideration of life goals, e.g., "I change the way I feel and act so often that I sometimes wonder who the 'real' me is" {reverse coded}), and work orientation (i.e., pride in the successful completion of tasks, e.g., "I hate to admit it, but I give up on my work when things go wrong" {reverse coded}). The scale contains 30 items to which participants respond on a 4-point Likert scale ranging from "Strongly Agree" to "Strongly Disagree". All items in the PSMI (exclusive of psmi18) are reverse coded so that higher scores indicate more responsible behavior.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Quality of Romantic Relationships

The Quality of Romantic Relationships inventory was adapted for this study to evaluate the support, conflict, and depth of the adolescent's romantic relationships (Pierce, 1994; Pierce, Sarason, Sarason, Solky-Butzel, & Nagle, 1997). This scale assess the relationship along 5 dimensions: Quality of Relationship (e.g., "In general, how happy are you with your relationship?"), Knowledge of Behavior and Deviance (e.g., "How much does {Name} know who you spend time with?"), Tolerance of Deviance (e.g., "Would {Name} know if you have been using drugs?"), Antisocial Influence (e.g., "Has X suggested that you should sell drugs?"), and Antisocial Behavior (e.g., "Has X damaged/destroyed property?". The fourth and fifth subscales were derived from items mirroring the ones asked regarding peer delinquency; but using the romantic partner, not the peers, as the referent person. In addition, for those youth who live with their romantic partner, two additional questions assess how much the romantic partner monitors the behavior of the participant. For each question, the participant responds on a 4-point Likert scale ranging from "not at all" to "very much"; therefore, for the first three subscales, higher scores indicate a more symbiotic romantic relationship (some items are reversed coded in the scoring stage) and for the last three subscales, more antisocial influence, antisocial behavior and more monitoring respectively.

This inventory was administered at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about the inventory.

Resistance to Peer Influence

The Resistance to Peer Influence (Steinberg, 2000) measure was developed for this study to assess the degree to which adolescents act autonomously in interactions with their peer group. Participants are first presented with two conflicting scenarios (e.g., "Some people go along with their friends just to keep their friends happy" and "Other people refuse to go along with what their friends want to do, even though they know it will make their friends unhappy") and are then asked to choose the scenario which most closely reflects their behavior. Finally, the participant is asked to rate the degree to which the statement is accurate (i.e. "sort of true" or "really true"). Ten such sequences are presented to the participant, each exploring a different dimension of potential influence: go along with friends, fitting in with friends, changing their mind, knowingly do something wrong, hiding true opinion, breaking the law, changing the way you usually act, taking risks, saying things don't really believe, going against the crowd.

To create an overall resistance score, each dimension is assigned a score from one to four reflecting the particular combination of answers provided by the subject. For example, choosing "some people go along with their friends just to keep their friends happy" followed by "really true of me" results in a score of one, while choosing "other people refuse to go along with what their friends want to do" followed by "really true of me" results in a score of four. This is repeated for all ten dimensions.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Revised Children's Manifest Anxiety Scale (RCMAS)

The Revised Children's Manifest Anxiety Scale (RCMAS; Reynolds & Richmond, 1985, 2000) is a 37-item, self-report instrument designed to assess the level and nature of anxiety. A response of "Yes" indicates that the item is descriptive of the subject's feelings or actions, whereas a response of "No" indicates that the item is generally not descriptive. A Total Anxiety score is computed based on 28 items, which are divided into three anxiety subscales: physiological anxiety (10 items about somatic manifestations of anxiety such as sleep difficulties, nausea and fatigue), worry/oversensitivity (11 items measuring obsessive concerns about a variety of things, most of which are typically vague and ill-defined, as well as fears about being hurt or emotionally isolated), and social concerns/concentration (7 items measuring distracting thoughts and fears that have a social or interpersonal nature). The remaining nine items on the RCMAS constitute the Lie subscale. Because scores are derived from affirmative responses, a high score indicates a high level of anxiety or lie on that subscale. A high score on the physiological anxiety scale suggests that the youth has certain kinds of physiological responses that are typically experienced during anxiety. A high score on the Worry/oversensitivity scale may suggest that the youth internalizes much of the anxiety and may thus become overburdened with trying to relieve the anxiety. Finally, a high score on the Social concerns/concentration subscale suggests that they youth my feel some anxiety that they are unable to live up to the expectations of other significant individuals in their lives. (Reynolds & Richmond, 2000).

These questions were asked at baseline only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Routine Activities

Items from the Routine Activities measure were drawn from the "Monitoring the Future Questionnaire" (Osgood, Wilson, O'Malley, Bachman, & Johnston, 1996) and are used to assess the frequency of unstructured socializing. Items specifically tap activities that occur in the absence of an authority figure (e.g., "How often did you get together with friends informally?"). The scale contains 3 items to which participants respond on a 5 - point Likert scale ranging from "Never" to "Almost every day". Higher scores indicate a greater involvement in unstructured activities. A fourth item is asked to specify the number of evenings in a typical week the participant spends on "fun" activities. Items were previously scored independently without an "unstructured socializing" total score (Osgood, et al., 1996); however, a combined score was created for the purpose of this study.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Self-Reported Offending

The Self-Reported Offending (SRO; Huizinga, Esbensen, & Weihar, 1991) was adapted for this study to measure the adolescent's account of involvement in antisocial and illegal activities. The SRO consists of 24-items which elicit subject involvement in different types of crime. For each endorsed item, a set of follow-up questions are triggered that collect more information regarding the reported offense (e.g., "How many times have you done this in the past N months?"). The follow-up items can be used to identify whether the adolescent reports doing an act within the recall period, as well whether or not the act was committed alone or with a group.

This information is collected at baseline and all follow-waves. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this measure.

Services and Medication

Participation in both residential and community-based social services is assessed through a modified version of the Child and Adolescent Services Assessment (CASA; Burns, et al., 1992). At the baseline interview, subjects are asked if they have received services in a range of settings (e.g., alcohol/drug treatment, psychiatric treatment, hospitalizations, foster care, family counseling, detention/prison/jail stays, priest/minister/clergy visitations) across both the juvenile justice and the mental health sector. Once endorsed, follow-up questions obtain the age at the initial receipt of the treatment and the recency of this service use.

A history of prescribed medication use is also obtained. Medications were elicited through the following question: "Have you ever had a prescription for a medication that was to help you with your emotions or behavior?". We obtain medications used prior to the past six months, those used during the past six months, and medications used at the time of the baseline interview as well as the recency of last dose. Each unique medication was subsequently assigned a three-digit code based on the medication name and a three-digit medication classification code (e.g., anti-psychotic vs. antidepressant, etc.). This coding scheme was originally developed for the MacArthur Risk Assessment study (see Monahan et al, 2001) with new medications added as necessary.

This information is provided for the baseline interview only. Additional information about employment during the follow-up period is provided in the Out-of-Community Placement and Community-based services calenders. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Social Capital

The Social Capital Inventory measures the connectedness an adolescent feels to his/her community (Nagin & Paternoster, 1994). This concept is explored along three dimensions: intergenerational closure (e.g., "How many of the parents of your friends know your parents?"), social integration (e.g., "How many of your teachers do your parents know by name?"), and perceived opportunity for work (e.g. "Employers around here often hire young people from this neighborhood?"). The measure contains 19 items; however, only 13 are considered in scoring. Higher scores indicate greater degree of community connectedness.

This information is provided for the baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Socioeconomic Status

This section contains questions regarding socioeconomic status. We have computed two different versions of socioeconomic status, one that is based on education alone and the other which combines both education and occupation. More detailed information about each of these is provided below.

This information was included in the baseline interview only. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Substance Abuse

The Substance Use/Abuse Inventory is a modified version of a substance use measure developed by Chassin et al., 1991 for use in a study of children of alcoholics. This measure considers the adolescent's use of illegal drugs and alcohol over the recall period. The self-report measure is comprised of the following subscales: Substance Use (e.g., "How often have you had alcohol to drink?") and Social Consequences, Dependency & Treatment (e.g., "Have you had problems or arguments with family or friends before because of your alcohol or drug use?"/ "Have you wanted a drink or drugs so badly that you could not think of about anything else?").

This information is provided for the baseline and all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Threat Control Override

The Threat/Control Override Psychotic Symptoms Scale (TCO; Link, Stueve, & Phelan, 1998) is used to measure the presence of three specific psychotic-like symptoms that have been found to have an association with violence in prior research of the link between mental illness and violence. Items from the measure assess the belief that others are seeking to do the adolescent harm, or that outside forces are in control of the adolescent's mind. The adolescent responds to these three items on a 5-point Likert scale ranging from "Never" to "Very Often," with higher scores indicating greater delusional symptoms.

These questions were asked at baseline and at each follow-up interview. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.

Weinberger Adjustment Inventory (WAI)

The Weinberger Adjustment Inventory (WAI; Weinberger & Schwartz, 1990) is an assessment of an individual's social-emotional adjustment within the context of external constraints. There are 4 subscales: Impulse control (e.g., "I say the first thing that comes into my mind without thinking enough about it".), suppression of aggression (e.g. "People who get me angry better watch out".), consideration of others (e.g., "Doing things to help other people is more important to me than almost anything else".) and temperance. The measure asks participants to rank how much (1= False to 5= True) their behavior in the past six months matches a series of statements. Higher scores on each of the subscales delineated below indicate more positive behavior (i.e. more impulse control, greater temperance and greater consideration for others).

The WAI questions were asked of the collateral reporter at baseline and at all follow-up interviews. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this inventory.

Youth Psychopathic Traits Inventory

The Youth Psychopathic Traits Inventory (YPI; Andershed, Kerr, Stattin and Levander, 2002) is a self-report measure that assesses psychopathy among youth. Items from the measure make up the following ten subscales: dishonest charm (e.g., "I have the ability to con people by using my charm and smile"), grandiosity (e.g., "I'm better than everyone on almost everything"), lying (e.g., "Sometimes I lie for no reason, other than because it's fun"), manipulation (e.g., "I can make people believe almost anything"), remorselessness (e.g., "To feel guilt and regret when you have done something wrong is a waste of time"), unemotionality (e.g., "I usually feel calm when other people are scared"), callousness (e.g., "I think that crying is a sign of weakness, even if no one sees you"), thrill seeking (e.g., "I like to be where exciting things happen"), impulsiveness (e.g., "I consider myself as a pretty impulsive person"), and irresponsibility (e.g., "I have often been late to work or classes in school").

Additionally, the measure taps three dimensions of psychopathy: Grandiose Manipulative Dimension, Callous Unemotional Dimension, and Impulsive Irresponsible Dimension. The scale contains 50 items to which participants respond on a 4-point Likert scale ranging from "Does not apply at all" to "Applies very well". Several items in the scale are reverse coded so that higher scores indicate more psychopathic characteristics.

These questions were asked at all interviews except the baseline. See the Pathways to Desistance website at: www.pathwaysstudy.pitt.edu for additional information about this question set.
